# Checking Unique Hamiltonicity

Benedikt Klocker

Algorithms and Complexity Group Institute of Computer Graphics and Algorithms TU Wien

PHD Seminar, 18 Dezember 2017

# Definition (UHG)

If a graph contains exactly one hamiltonian cycle it is called a *uniquely hamiltonian graph* (UHG).

# Conjecture by Bondy and Jackson

Every planar uniquely hamiltonian graph has at least two vertices of degree two.

#### Goal

Find a simple planar uniquely hamiltonian graph with minimum degree 3 and therefore disprove the conjecture of Bondy and Jackson.

# acılı

# Removing unvisited vertices

#### Removing unvisited vertices

**ac** III Let G be a graph. We call the pair (e, C), where C is a cycle and e an edge occuring in C a fixed edge cycle, or short FE-cycle. An FE-cycle (e, C) is called maximal if there is no other FE-cycle (e, C') with  $V(C') \supseteq V(C)$ . An FE-cycle (e, C) is called unique if there is no other FE-cycle (e, C') with V(C') = V(C) and  $C' \neq C$ .

#### Simplified Goal

Find a simple planar graph with minimum degree 3 which contains a unique maximal dominating FE-cycle.

First Approach=

#### New Goal

Find a simple planar graph with minimum degree 3 which contains a unique maximal dominating FE-cycle.

benumerate

Generate (all) planar graphs (with a fixed number of vertices) with minimum degree 3.

For each generated graph G, check if it contains a unique maximal FE-cycle by doing the following:

1. For each edge e in G repeat the following steps until no new maximal FE-cycle with e as the fixed edge could be found:

1.1 Find a new maximal FE-cycle with e as the fixed edge.

1.2 Check if the FE-cycle is unique. benumerate

Generate (all) planar graphs (with a fixed number of vertices) with

**ac** IP or each generated graph *G*, check if it contains a unique maximal FE-cycle by doing the following:

1. For each edge *e* in *G* repeat the following steps until no new maximal FE-cycle with *e* as the fixed edge could be found:

1.1 Find a new maximal FE-cycle with e as the fixed edge.

benumerate

- 2. Generate (all) planar graphs (with a fixed number of vertices) with minimum degree 3.
- 3. For each generated graph *G*, check if it contains a unique maximal FE-cycle by doing the following:
  - 3.1 For each edge e in G repeat the following steps until no new maximal FE-cycle with e as the fixed edge could be found:
  - 3.1.1 Find a new maximal FE-cycle with e as the fixed edge.
  - 3.1.2 Check if the FE-cycle is unique.

# ac Ibenumerate

# ac<sup>IIII</sup> \_\_\_\_\_\_ ILP model for Finding a Maximal FE-cycle

#### Input

A graph G = (V, E), an edge  $e_0 = i_0 j_0 \in E$  and a set C of all maximal FE-cycles with e as the fixed edge found until now.

#### Variables

• 
$$(x_v)_{v \in V} \dots x_v = 1$$
 iff  $v \in V$  is used in the cycle

▶ 
$$(y_e)_{e \in E} \dots y_e = 1$$
 iff  $e \in E$  is used in the cycle

# acılıı

ILP model for Finding a Maximal FE-cycle cont.

Objective:

$$\max \sum_{i \in V} x_i$$

**Constraints:** 

$$\sum_{j \in N(i)} y_{ij} = 2x_i \quad \forall i \in V$$
(1)

$$y_{i_0j_0} = 1 \tag{2}$$

$$\sum_{i \in V \setminus C} x_i \ge 1 \quad \forall C \in \mathcal{C}$$
(3)

$$\sum_{e \in \delta(V')} y_e \ge 2x_i \quad \forall \emptyset \neq V' \subseteq V \setminus \{i_0\}, i \in V'$$
(4)

$$y_e \in \{0,1\} \quad \forall e \in E$$
 (5)

$$x_i \in \{0,1\} \quad \forall i \in V$$
 (6)

# ac<sup>IIII</sup> \_\_\_\_\_\_\_ ILP model for Checking Uniqueness of FE-cycle

 iff  $e \in E$  is used in the cycle

# acılı

ILP model for Checking Uniqueness of FE-cycle cont.

# No objective (only feasibility interesting)

**Constraints:** 

$$\sum_{j \in \mathcal{N}(i)_C} y_{ij} = 2 \quad \forall i \in V_C \tag{7}$$

$$y_{i_1 i_2} = 1$$
 (8)

$$\sum_{e \in \delta(V')} y_e \ge 2 \quad \forall \emptyset \neq V' \subseteq V_C \setminus \{i_1\}, k \in V'$$
(9)

$$\sum_{ij\in E_C\setminus E(C)} y_{ij} \ge 2 \tag{10}$$

$$y_e \in \{0,1\} \quad \forall e \in E_C \tag{11}$$

- ► Store for each set of vertices V' and for each edge e a list of all cycles found until now using the edge e and the vertices V'.
- ► In the first phase only search cycles for new vertex sets or new edges.
- ► In the second phase we do not have to check FE-cycles for which there are already two cycles containing the fixed edge.

# acılı

Reusing ILP-states

- ► Goal: Reuse ILP-tree after maximal cycle got found.
- ► Use callback to store every found cycle in C and add the constraint (3) for every cycle.
- The found cycles don't have to be maximal!
- ► The constraint (3) ensures that afterwards only larger cycles or not comparable cycles get found
- If a larger cycle gets found remove all smaller cycles from the datastructure C and the according constraints from the model, since they get dominated from the new constraint.
- If no new cycle got found, all cycles in the datastructure are maximal and no other maximal cycle exists
- ► The ILP terminates as infeasible, since all work happens in the collection of the cycles during the callback.

# ac<sup>ılıı</sup> Minimal Counter Example

#### Goal

Find properties for a minimal planar graph with minimum degree 3, which contains a unique maximal FE-cycle. Reduce the number of graphs to test drastically by only testing candidates for a minimal counter example.

By minimal we mean minimal according to the following relation.

# Definition

Let  $G_1 = (V_1, E_1)$  and  $G_2 = (V_2, E_2)$  be two graphs. Then we say  $G_1 \leq G_2$  iff

$$|V_1| < |V_2| \lor (|V_1| = |V_2| \land |E_1| \le |E_2|).$$

#### Definition

A vertex with degree 3 or less is called a *small* vertex and otherwise a *large* vertex.

- ► *C* is dominating
- ► *G* is 3-connected
- Every neighbor of a large vertex is in V(C)

# acılıı

#### Construction of Candidate Graphs

- ▶ We use plantri to construct planar graphs
- ► Plantri constructs only one graph per isomporphism-class
- ▶ We can fix a number of vertices and give an upper bound for the number of edges  $(|E| \le 2n 4)$ . Then we can filter the results by the other properties of a minimal counter example.
- Disadvantages:
- ► The upper bound for the edges is only a filter and therefore not efficient
- ► All filters together filter out most of the generated graphs, only a small part is really interesting (especially the property that the graph has no triangles)

# acılı

Construction of Candidate Graphs through Dual Graphs

New idea: Generate dual graphs with plantri

► Use the edge upper bound to get an upper bound for the faces:

$$|F| = |E| - |V| + 2 \le 2|V| - 4 - |V| + 2 \le |V| - 2$$

- ► The dual graph of a 3-connected graph is also 3-connected
- ► The dual graph has minimum degree 4 since the original graph contained no triangles

To get all relevant graphs with at most n vertices we construct all dual graphs with the above properties with at most n - 2 vertices and build the dual graphs of them.
